About the image
This is a mosaiced, or "stitched-together" image made up of six separate digital orthophotos. A digital orthophoto is a computer-generated image of an aerial photograph in which displacements caused by the camera and terrain have been removed. It combines the image characteristics of a photograph with the geometric properties of a map.

The aerial photographs were taken on May 16, 1992 and were computer-generated by the US Forest Service.
